

ER MODEL

RELATIONAL MODEL

Functional Dependencies

1) Manager

- Manager_name \rightarrow team_name

Since the determinant of the only FD that holds on this relation is its primary key, this relation is in BCNF form.

2) Team

- Team_name \rightarrow matches_played
- Team_name \rightarrow won
- Team_name \rightarrow draw
- Team_name \rightarrow lost
- Team_name \rightarrow goals_for
- Team_name \rightarrow goals_against
- Team_name \rightarrow points

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

3) Coach

- Coach_name \rightarrow team_name

Since the determinant of the only FD that holds on this relation is its primary key, this relation is in BCNF form.

4) Venue

- Venue_name \rightarrow team_name (home ground)
- Venue_name \rightarrow capacity
- Venue_name \rightarrow city

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

5) Match

- Match_number -> date
- Match_number -> mom
- Match_number -> home_team
- Match_number -> away_team
- Match_number -> score_a
- Match_number -> score_h

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

6) Referee

- Ref_licence_no -> name

Since the determinant of the only FD that holds on this relation is its primary key, this relation is in BCNF form.

7) Goals

- Goal_id -> goal_schedule
- Goal_id -> goal_time
- Goal_id -> goal_type
- Goal_id -> goal_half
- Goal_id -> assisted_by
- Goal_id -> match_number
- Goal_id -> scored_by

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

8) Player

- Player_id->name
- Player_id-> jersey_no
- Player_id->nationality
- Player_id->age
- Player_id->team_name

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

9) Position

- Pid->description

Since the determinant of the only FD that holds on this relation is its primary key, this relation is in BCNF form.

10) Captain

- {player_id, team_id} -> start_date
- {player_id, team_id} -> end_date

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

11) Booking

- {match_number, player_id} -> booking_time
- {match_number, player_id} -> booking_type
- {match_number, player_id} -> play_schedule

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

12) Substitution

- {player_id_out, match_number} -> play_schedule
- {player_id_out, match_number} -> time_in_out
- {player_id_out, match_number} -> player_id_in

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

13) Has_referee

- {match_number, ref_licence_no} → type

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

14) Contact_details

- Email → team_name
- Email → contact_number

Since the determinant of every FD that holds on this relation is its primary key, this relation is in BCNF form.

15) Plays_on

- No FDs are present.

Since it's a 2-attribute relation (both of which are a part of the primary key), it is in BCNF form.
